RR51 Regulator Rectifier

APPLICATIONS

Ducati, Moto Guzzi and Laverda

INSTALLATION INSTRUCTIONS

Two wire stator connection

Hook the wires up according to the DIAGRAM 1 if the stator only has two wires coming from it. The two YELLOW wires are the phase inputs, the GREEN connects to the battery negative, the RED connects to the battery positive and the WHITE is the charge warning light output.

NOTE: Voltage sensing input from the ignition switch is built into the part.

You will have a RED wire left over. Make sure you cap it off, so it can't short out to the frame. Our RR51 is designed to work properly and safely without the 30A main fuse in the system.

Diagram 1 - Setup with two wire stator

Three Wire Stator Connection

If the stator is a three wire type, with two YELLOW wires and one red one coming from it, hook it up according to DIAGRAM 2. The difference is that the two YELLOW wires are connected together and connect to one YELLOW input wire on the RR. The RED wire from the stator connects to the other YELLOW RR input. The other connections of the RR are like in DIAGRAM 1.

If this setup doesn't produce any power, then the stator is wound differently (on some models this is the case) Forget about the RED wire emerging from the stator, and hook it up like in DIAGRAM 1. Then you will then have the full output available.
